

Same Flower Updated Testing Regulations

You may start to notice subtle differences on THC testing results on products. Rest assured, you are still receiving the same exceptional products.

These adjustments stem from recent updates to testing regulations enacted by the CCC in December 2023.

What's changed?

The modification pertains to the calculation of total THC. You'll observe that the Total Active Cannabinoids (TAC) in many Flower products now register as lower than THCA. No need for concern; this is entirely accurate.

The bottom line:

The potency and quality of flower remain constant. The revised CCC-mandated testing formula for TAC introduces a variance that lowers TAC to accommodate moisture content.
